

Startup Evaluation Report

Generated on: January 06, 2026

Feasibility Score

87/100

Executive Summary

The Automated College Placement Tracking System is a web-based platform that helps colleges track student eligibility, company applications, and interview rounds in a centralized dashboard. Students can view eligible companies, upload resumes, and track application progress. The system targets engineering and arts colleges and operates on an annual institutional subscription model.

Problem Statement

The problem being solved is the inefficiency and disorganization in college placement processes, which can lead to missed opportunities and a poor candidate experience.

Target Users

The target user segment is placement cells in engineering and arts colleges, as well as students applying for internships and jobs through these colleges.

Market Potential

The market potential is significant, with thousands of colleges and universities in the US and globally that could benefit from a centralized placement tracking system.

Technical Feasibility

The idea can be built using standard web development technologies such as HTML, CSS, JavaScript, and a database management system like MySQL. The system can be developed using a RESTful API and a cloud-based infrastructure like AWS or Google Cloud. The technical feasibility is high, with a score of 85.

Innovation & Uniqueness

The idea is not particularly innovative, as there are already several placement tracking systems available in the market. However, the system's ability to integrate with existing college systems and provide a centralized dashboard for students and placement cells is a unique feature.

Risks & Challenges

The main risks and challenges are the competition from existing placement tracking systems, the need to integrate with existing college systems, and the potential for technical issues and data security breaches.

Strengths

- Provides a centralized dashboard for students and placement cells
- Integrates with existing college systems
- Operates on an annual institutional subscription model

Weaknesses

- Competition from existing placement tracking systems
- Need to integrate with existing college systems
- Potential for technical issues and data security breaches

Improvement Suggestions

- Develop a more user-friendly interface for students and placement cells

- Integrate with more college systems and platforms
- Implement robust data security measures

Final Recommendation

The Automated College Placement Tracking System is a feasible idea that can be developed using standard web development technologies. However, it is essential to differentiate the system from existing placement tracking systems and address the potential risks and challenges.
